PhotoLock Tying photo integrity to a specific device

Team 4 John Dale, Darius Paradie, Jace Christakis, Dani Kasti

Problem Statement

Images, which once were viewed as a source of undeniable proof, have now become targets of societal manipulation. Most of the population utilizes online platforms such as Twitter and Google for news where images are posted daily; Twitter alone has over 500 million active users. The negative impact of altered or AI generated images on society includes body dysmorphia, political disruption, and proliferation of conspiracy theories.

Updated Solution Overview

Hardware Root of Trust

Solution Overview Part 2

University of Massachusetts

Amherst

Department of Electrical and Computer Engineering

Assumptions

1. Raspberry Pi 4 memory is tamper-proof

a. Media can only be sent off the camera through WiFi upload

2. Sensor to Microcontroller interfaces are secure

- a. GPS
- b. Camera
- 3. GNSS Time and Location data are only used when possible
- 4. Storing images and video locally when WiFi is unavailable

Solution Comparison:

	Sony Alpha 7 IV camera	Capture Cam - Photo Verify (Image block chain)	Google Reverse Image search	Our Solution
Cost	\$2,499.99	FREE	FREE	\$350
Root of Trust	YES	MAYBE	N/A	YES
Online Media Verification	ΝΟ	YES	ΝΟ	YES
Automatic Wireless Upload	NO	NO	N/A	YES
Open Source	NO	YES	NO	YES
Location and Time	NO	NO	NO	YES

PhotoLock: Our Solution Goals

- 1. Hardware Root of Trust
- 2. Online Media Verification
- 3. Automatic Wireless Upload
- 4. Open Source Transparency
- 5. Location and Time Metadata
- 6. Reasonable Cost (<\$500)

GNSS Sensor: NEO-M7N Module

- Crystal and TXCO LCC (surface mount) oscillator options available for the NEO-7 series
- Schematics and datasheets support integration into PCB design
- Over 2,000 units available on Digikey
- Many compatible interfaces allow for alternative options (SPI, USB, UART)
- GPS and GNSS functionality

Trusted Platform Module: Infineon 9673

- 4 Endorsement Keys
- SPI interface
- Low standby power consumption
- FIPS 140-2 Level 2
 - Formally validated by US and Canadian Governments
- AVA_VAN.4 Certification
 - Methodical vulnerability analysis and resistance against a moderate attack potential

Raspberry Pi 4

- RAM memory: 2 GB
- Memory storage capacity: 2 GB
- Connectivity: Bluetooth, WIFI, USB, ethernet, HDMI, GPIO
- Micro SD card slot for loading operating system and data storage

Linux Version

- Raspberry Pi OS
- Best compatibility for Raspberry Pi 4
- Debian based OS

PCB Design

• Custom PCB \rightarrow integration of breakout boards

- GPS evaluation board
- TPM evaluation board
- Linear regulator to minimize noise (instead of buck converter)
 - capacitors and diodes

Layout of GPS Breakout Board

Benefits of Breakout Board Integration

- Ease of access to components
- Minimize errors by removing RF design component
- Ease of integration from Raspberry Pi to PCB
- Ensure proof of concept

Example layout showing difficulty of RF shielding

Example schematic showing filtering for antenna

Generic Model: PCB Integration through Raspberry Pi Hat

Previous PCB Integration Issues Solved

- Difficulty connecting to TPM
 - SPI interface operates at high frequency SOLVED Closer traces from pi header to TPM
 - Jumper cables did not provide stable connections
 - Inability to connect TPM from PI to jumpers
 - TPM library closed source (limited pin selection) SOLVED -Adjusted pin configuration
- Integration of GPS to PCB
 - GPS interface not compatible with PCB pinout due to SOLVED -Access to two interfaces library

TPM connection to PI unreliable

TPM fails to connect through PCB

TPM connects through PCB but connection is lost

Reference Slides

Survey of Similar Solutions

Sony Alpha 7 IV camera [1]

- Supports detection of any modification to an image, thus protecting it from fraudulent usage
- Eliminates unauthorized editing and misconduct around digital photo data
- For corporate users only

But this method is:

- 1. Expensive: Unaffordable for the general public
- 2. Not open source

Survey of Similar Solutions

Capture Cam - Photo Verify (Image block chain) [2]

- An application that uses the camera of mobile phones with blockchain technology to transform photos into verifiable and secure digital assets.
- Marketed to protect against AI generated fake images

But this method is:

 Not spoof-proof: Cannot guarantee whether an image has been modified or artificially generated

Survey of Similar Solutions

Other solutions of verifying image integrity involve

- Individual fact-checkers
- Reverse-image searching
- Image forensics

But these methods are:

1. Inefficient/slow: Not practical when waves of images are populating social media feed

Hardware Block Diagram Changes

PCB Design Process

- Emphasize importance of part selection
- Ensure correct orientation (evaluation board placement, ease of access, etc)
- Double check measurements
- Visualize integration (Raspberry $Pi \rightarrow 40$ pin PCB header, etc.)
- Investigate pin and footprint compatibility

Orientation

Footprint compatibility

Benefits of Breakout Board Integration

- Ease of access to components
- Minimize errors by removing RF design component
- Ease of integration from Raspberry Pi to PCB
- Ensure proof of concept

RF Shielding in PCB Layout
